zero waste solutions

**Become
a climate
hero!**

The environment wins with packaging licensing

More than just costs

Manufacturers and distributors are legally obliged to fulfill their product responsibility and to participate in a dual system for the sales packaging they place on the German market.

The costs are based on the packaging material used and its weight. The licensing fees paid by our customers contribute to specific measures for environmental protection.

By licensing your packaging, you support the efficient collection, sorting and recycling of packaging waste and help to preserve valuable resources.

We possess comprehensive recycling expertise within the Interzero Group and cover the entire range of environmental services along the disposal and recycling chain. Interzero ensures the efficient recycling of all packaging that you license with us – **proven and certified.**

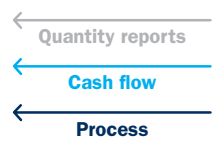

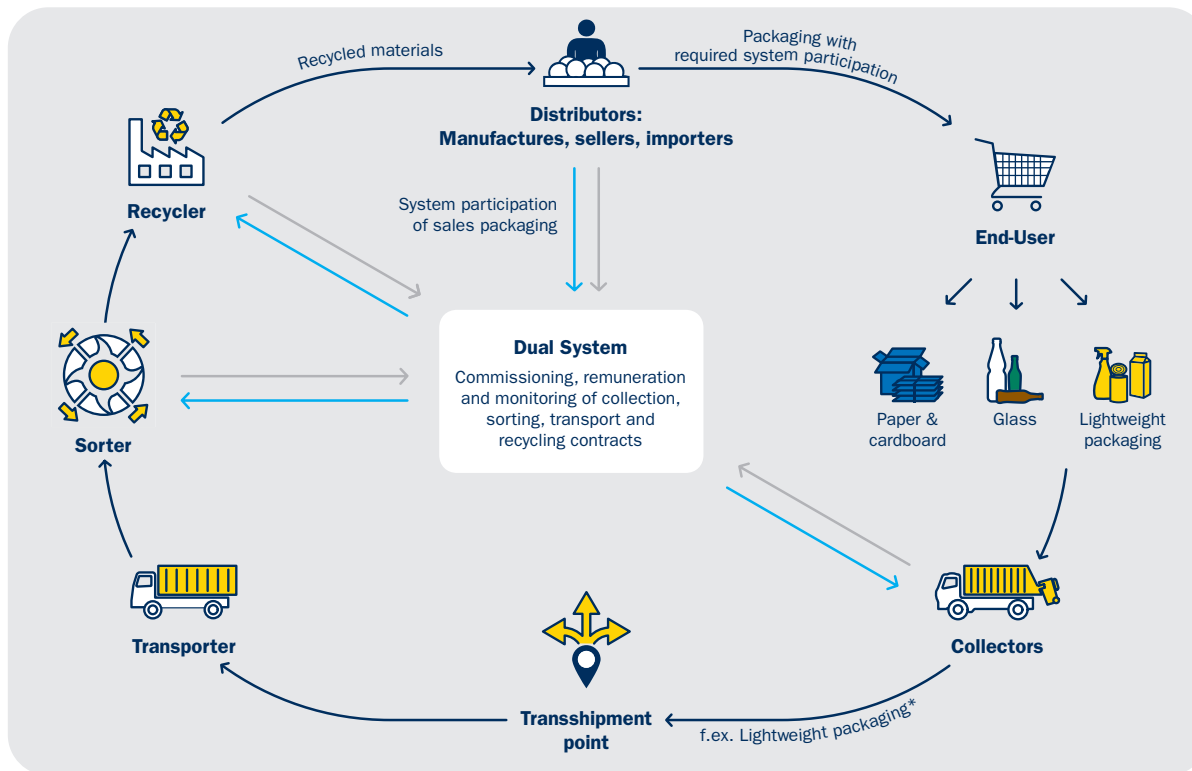

A visible commitment to the environment – resources **SAVED**

With Interzero as your partner you actively contribute to environmental and climate protection and ensure that the burden on future generations is reduced in the long term.

Our recycling activities saved around 8.7 million tons of primary raw materials and around 1 million tons of greenhouse gases in 2022 alone. With the customer-specific resource conservation certificate, we document the amount of primary resources and harmful greenhouse gases you have saved through our recycling activities and your participation.

The dual system Interzero Recycling Alliance

* For the fractions paper and glass, the following steps apply:

- Paper:**
 - Collection
 - Transshipment
 - Paper factory
- Glass:**
 - Collection
 - Transshipment
 - Recycling
 - Glassworks

A well-functioning circular economy

Designing, collecting, sorting, recycling:

A comprehensive circular economy makes a significant contribution to reducing resource consumption and environmental pollution.

Packaging optimization „Made for Recycling Interzero“

An environmentally friendly packaging design is the first step towards optimal recycling. Designing packaging so it can be recycled sustainably is not only demanded by consumers, but also required by law. How recyclable is your packaging? With our scientific evaluation method „Made for Recycling“, we can determine the recyclability of your packaging and provide you with advice for optimization.

Integrated licensing system

Modern sorting facilities and high-performance processing technologies are required for a functioning recycling loop. As an innovative environmental service provider, Interzero carries out the entire recycling process for plastics in-house – from licensing the packaging to sorting and processing. This allows for a higher recovery rate of recyclable materials from packaging waste.

Maximum sorting performance with the market leader

Interzero handles the highly efficient sorting of lightweight packaging (LVP) and mixed recyclables for customers throughout Europe. We operate five of the largest sorting plants in Germany. Our environmental and process engineering experts sort around 33 percent of lightweight packaging generated throughout Germany.

Plastics processing at the highest level

At Interzero, we work intensively on the development of high-quality recycled plastics for various market requirements. With our own competence centre for recycled plastics, we develop regranulates that can entirely replace primary plastics in the production of new high-quality plastic goods.
